## Patient Treated on ClearVue™ Prone Breast Table

**Bedford, MA, June 30, 2009** – Orbital Therapy announces the installation and clinical use of ClearVue™ prone breast table in radiotherapy at Greenwich Hospital in Greenwich, CT.

The patient was simulated in the prone position using a CAT scanner, and radiation treatment was delivered on a standard linear accelerator. Prone breast radiotherapy is quickly gaining popularity as many studies point to better dose distribution and potentially less long term complication and side effects associated with the treatment. “This is a major milestone for the company. ClearVue™ prone breast was designed with patient comfort in mind, and allows prone breast treatments to be implemented by large and small radiotherapy centers alike”, said Jason Koshnitsky, CEO of Orbital Therapy.

Orbital Therapy’s all carbon fiber ClearVue™ prone position table was designed to address current and future requirements to deliver this emerging therapy technique. Placing the patient in the prone position also reduces organ motion and allows for better localization of the treatment area.

ClearVue™ offers a number of advantages over other commercially available prone position tables. Our unique, patent-pending open design provides visual and treatment access to the breast allowing to plan and treat from multiple angles.

The interchangeable mid-section allows you to quickly adjust the table configuration between various inserts, available in a number of different sizes and shapes. There is also an option for users to design their own custom inserts.

### About Orbital Therapy, LLC

Orbital Therapy was founded in 2006 to develop products for the treatment of breast cancer. Our innovative approach to the treatment of this particular disease will offer numerous benefits over currently used techniques and provide many benefits to the patient, as well as the care provider.
